

Grocery Store Checklist

A command-line program to build a grocery list, check items off, and track progress

Ankith Srivathsan

```
[X] apples (Produce)
```

```
[ ] milk (Dairy)
```

```
[ ] bread (Pantry)
```

```
Progress: 1 of 3 checked off.
```

Small commits and a small scope kept the build on track

1

Test, then commit

Every feature got its own commit and a quick run first, so a bug was always in the last few lines.

2

A small scope

Five menu options and nothing extra. The core loop worked early, and each feature built on it.

A late start and indentation slips cost the most time

1

A late start

I was sick and started on the due date, so every commit landed on the same day.

2

Indentation slips

A print inside the wrong loop and similar slips cost debugging time. Sketching the nesting first would help.

Dropping functions kept the code inside Chapters 1-7

PLANNED

One function per menu
option

BUILT

One while loop with
if/elif/else

Functions are Chapter 8, outside the required material.

Late bug: removing a checked-off item left it in the list, so the progress count went wrong.
Fixed in its own commit.

Next time: start early and test before every commit

1

Start on day one

A little each day spreads commits across the whole project.

2

Test before every commit

A quick run keeps broken code out of the commit history.
